

# ROOFING UNDERLAY TIGHTENER

- Simple and quick to install
- Protects against wear and damage
- Prevent noise
- Avoids rainwater accumulation
- 100% water and frost resistant

The buffeting of wind against the roof can cause the underlay to flap beneath the tiles, resulting in wear to the membrane, and damage from rubbing against tile hooks and clips. Moreover, the flapping can create a significant noise issue for the building's occupants.

The Kima Underlay Tightener provides a permanent and stable solution to these problems and can be used with all types of underlay. Simple and fast to install, using a self-locking strip tie (supplied), the Tightener ensures that the underlay stays flat and that rainwater does not accumulate, but is free to run in to the gutter.

## ROOFING UNDERLAY TIGHTENER

The Kima Underlay Tightener is supplied ready to use.

Position at regular intervals between the underlay and the rafters.

Insert the self-locking striptie through the Underlay Tightener.

Pull the tie firmly to fix into position.

Image shows completed installation.
